

Austenitic Stainless steel offer grade 304

304 (18-9E)
304H (18-9H)
304D (18-9ED)
304ED (18-9DDQ)

Chemical composition

| Elements (%) | C | Si | Mn | Cr | Ni |
|-----------------|-------|------|------|-------|------|
| 304 (18-9E) | 0.05 | 0.40 | 1.10 | 18.20 | 8.05 |
| 304H (18-9H) | 0.05* | 0.40 | 1.10 | 18.20 | 8.05 |
| 304D (18-9ED) | 0.04 | 0.40 | 1.20 | 18.20 | 8.10 |
| 304ED (18-9DDQ) | 0.045 | 0.40 | 1.10 | 18.20 | 9.10 |

Typical values (*) C mini = 0.04

| Grade designation | European designation | American designation | IMDS Nr |
|--|--|---------------------------------------|-----------|
| 304 (18-9E) standard level grade | X5CrNi18-10 / 1.4301 ⁽¹⁾ | UNS 30400/ Type 304 ⁽²⁾ | 336812649 |
| 304H (18-9H) | X6CrNi18-10 / 1.4948 ⁽³⁾ | UNS 30409/ Type 304 ⁽²⁾ | 369292367 |
| 304D (18-9ED) deep drawing grade | X5CrNi18-10 / 1.4301 ⁽¹⁾ | UNS 30400/ Type 304 ⁽²⁾ | 336812649 |
| 304ED (18-9DDQ) severe deep drawing grade | X5CrNi18-10 / 1.4301 ⁽¹⁾ | UNS 30400/ Type 304 ⁽²⁾ | 336812649 |

⁽¹⁾ According to EN 10088-2

⁽²⁾ According to ASTM A 240

⁽³⁾ Accordind to EN 10088-1, 2005 / EN10028-7, 2007

These grades comply with:

- > Stainless Europe Material Safety Data Sheet n°1: stainless steels (European Directive 2001/58/EC).
- > European Directive 2000/53/EC on end-of-life vehicles and later modifications.
- > NFA 36 711 standard "Stainless steel intended for use in contact with foodstuffs, products and beverages for human and animal consumption (non packaging steel)".
- > Requirements of NSF/ANSI 51 – 2009 edition International Standard for "Food Equipment Materials" and of the F.D.A. (United States Food and Drug Administration) regarding materials used for food contact.
- > French Decree No.92-631 dated 8 July 1992 and Regulation No. 1935/2004 of the European Parliament and of the Council of 27 October 2004 on materials and articles intended to come into contact with food (and repealing Directives 80/590/EEC and 9/109/EEC).

- > French regulatory paper dated 13 January 1976 relating to materials and articles made of stainless steel in contact with foodstuffs.
- > Italian Decree of 21st March 1973w: a list of stainless steel types appropriate to "Regulations on the hygiene of packaging, receptacles and tools intended to come into contact with substances for food use or with substances for personal use"
- > PED (Pressure Equipment Directive) according to EN 10028-7 and AD2000 Merkblatt W2 and W10 (TÜV W494).

General characteristics

The principal features of our grades 304 (304, 304H, 304D, 304ED) are:

- > A general purpose grade
- > Good resistance to pitting corrosion and crevice corrosion
- > Good ductility
- > Excellent weldability
- > Good polish ability
- > Very good drawability for 304D (18-9ED) and 304ED (18-9DDQ)

Applications

- > Domestic appliances
- > Sink units
- > Metallic frames for the building industry
- > Serving trays and cutlery
- > Domestic cooking and catering equipment
- > Dairy equipment
- > Welded structures
- > Decorative tubes
- > Exhaust systems

Product range

Forms: Sheets, blanks, coils, strips, tubes

Thicknesses: from 0.3 up to 13 mm

Width: up to 2000 mm according to thickness

Finishes: cold rolled, hot rolled, patterned (tear plate), according to thickness

Physical properties

Cold rolled and annealed sheet.

| | | | | |
|---------------------------------------|----------|-----------------------------|-----------|------|
| Density | d | kg/dm ³ | 20 °C | 7.9 |

Creep properties

Creep is defined by a slow deformation of the metal as a result from a long term exposure to a certain level of stress below the yield strength. Together with the duration, the temperature is a significant factor to determine the mean stress (MPa) for rupture.

| Temperature (°C) | 100 h | 10 000 h | 100 000 h |
|------------------|-------|----------|-----------|
| 400 | 240 | 185 | 135 |
| 500 | 185 | 130 | 90 |
| 650 | 125 | 85 | 55 |

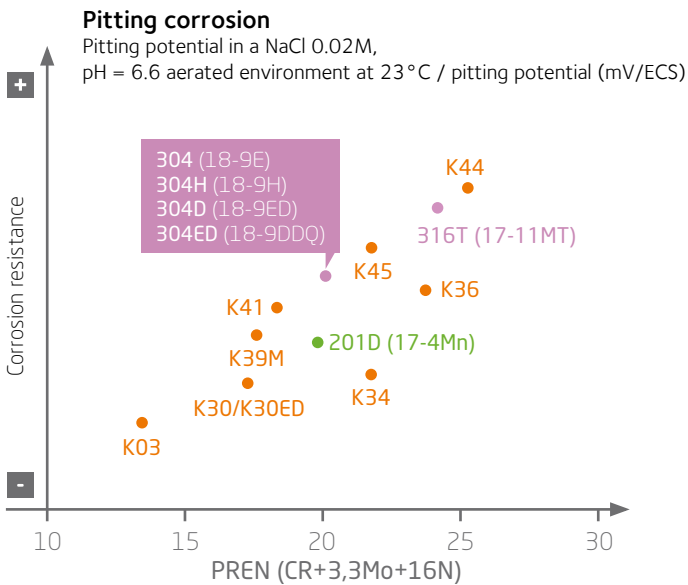

Typical values for 304 (18-9E) - MPa

Corrosion resistance

Our grades **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ) steels have good resistance to the common corrosive media, but are not recommended where there is a risk of intergranular corrosion. They are well adapted for exposure in fresh water and urban and rural atmospheres. In all cases, regular cleaning of exposed external surfaces is necessary to conserve their original appearance. Our grades **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ) grades have good resistance to various acids:

- phosphoric acid in all concentrations at ambient temperature
- nitric acid up to 65% (40° Baumé), between 20 and 50°C
- formic and lactic acids at room temperature
- acetic acid between 20 and 50°C.

It is recommended for use in contact with cold or hot foodstuffs, such as wine, beer, milk (curdled or otherwise), natural fruit juices, syrups, molasses, etc.

Pitting potential in variations following the temperature and the chloride concentration

| Grades | NaCl 0.02/23°C | NaCl 0.02/50°C | NaCl 0.05/23°C | NaCl 0.02/50°C |
|---|----------------|----------------|----------------|----------------|
| 304 (18-9E) 304H (18-9H) 304D (18-9ED) 304ED (18-9DDQ) | 540 mV | 385 mV | 305 mV | 175 mV |

Typical values

Crevice corrosion

Depassivation pH in a deaerated NaCl 2M environment at 23 °C

Crevice corrosion is a type of corrosion that can be divided in two processes. During the first process, called initiation, discrete pits are formed within the crevice region when locally the pH is below the depassivation pH of the grade. The propagation is the second process and is involved in the dissolution of metal. To slow down this process, molybdenum and nickel containing grades are to be preferred since both these elements have a positive effect on decreasing the speed of propagation.

Forming

In the annealed condition our **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ) can be readily cold formed by all standard processes such as bending, contour forming, drawing, flow turning, etc.

Some forming operations are more readily performed hot.

Subsequent pickling is necessary. For severe forming operations, our grades **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ) are to be preferred.

Deep drawing (Swift test)

The Swift test is a method to determine the Limiting Drawing Ratio (LDR). This LDR is defined by the maximum ratio between the blank diameter (variable) and the punch diameter (fixed) for which drawing can be performed successfully in one step.

| Grades | European designation | ASTM A240 | LDR* |
|-----------------|----------------------|-----------|------|
| 304 (18-9E) | 1.4301 | 304 | 1.96 |
| 304D (18-9ED) | 1.4301 | 304 | 1.98 |
| 304ED (18-9DDQ) | 1.4301 | 304 | 2.02 |
| 201D (17-4Mn) | 1.4618 | 201.1 | 1.92 |
| K41 | 1.4509 | 441 | 2.29 |
| K45 | 1.4621 | 445 | 2.28 |

* Limiting Drawing Ratio - Lubricant = Mobilux EP00
Typical values tests done on 0.8mm thick.

$$LDR = \frac{D_{max}}{d}$$

Stretching (Erichsen test)

The stretching behaviour is characterized by the dome height (h) of the Erichsen test which is also known as Index 'EI'.

Bending

Our grades **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ) have a good bending capacity up to 180°, with very small bending radii for thicknesses below 0.8 mm. For thicker gauges, a bending radius of at least half the thickness of the sheet is recommended. When bending the material, the elastic springback always has to be taken into consideration.

Flow turning

Our grades **304**, **304H**, **304D**, **304ED** (18-9E/H/ED/DDQ-1.4301) are the most suitable for this application.

| Grades | European designation | ASTM A240 | EI* (mm) |
|-----------------|----------------------|-----------|----------|
| 304 (18-9E) | 1.4301 | 304 | 11.6 |
| 304D (18-9ED) | 1.4301 | 304 | 11.8 |
| 304ED (18-9DDQ) | 1.4301 | 304 | 12.0 |
| 201D (17-4Mn) | 1.4618 | 201.1 | 11.9 |
| K41 | 1.4509 | 441 | 9.4 |
| K45 | 1.4621 | 445 | 9.5 |

* Erichsen Index - Lubricant = Mobilux EP00
Typical values tests done on 0.8mm thick.

Welding

⁽¹⁾ER 308L (AWS A5.9) = G 19 9 L (NF EN ISO 14343) ⁽²⁾ER 347 (AWS A5.9) = G 19 9 Nb (NF EN ISO 14343) ⁽³⁾E308L (AWS A5.4) = E 19 9 L (EN1600) ⁽⁴⁾ E 347 (AWS A5.4) = E 19 9 Nb (EN1600)

In general heat treatment is not required after welding. However in order to fully restore the corrosion resistance of the metal, the welds must be mechanically or chemically descaled, then passivated and decontaminated. If there is a risk of intergranular corrosion, a solution annealing treatment at 1075 ± 25°C must be carried out. However, in this case a low carbon grade such as our 304 (18-9L) (1.4307, Type 304L) or titanium stabilized grades such as our 321 (18-10T) (1.4541, Type 321) are recommended.

Heat treatment and finishing

Annealing

After cold forming (work hardening) and after welding (risk of intergranular corrosion in the weld joint), an annealing treatment for a couple of minutes at 1075 ± 25°C followed by air cooling restores the microstructure (recrystallisation and dissolution of carbides) and eliminates internal stresses. After annealing, pickling followed by passivation is necessary.

Pickling

> Nitric-Hydrofluoric acid mixture (10% HNO₃ + 2% HF) at ambient

temperature or up to 60°C.

> Sulfuric-nitric acid mixture (10% H₂SO₄ + 0.5% HNO₃) at 60°C.

> Descaling pastes for weld areas.

Passivation

> 20-25% HNO₃ solution (36° Baumé) at 20°C.

> Passivating pastes for weld zones.

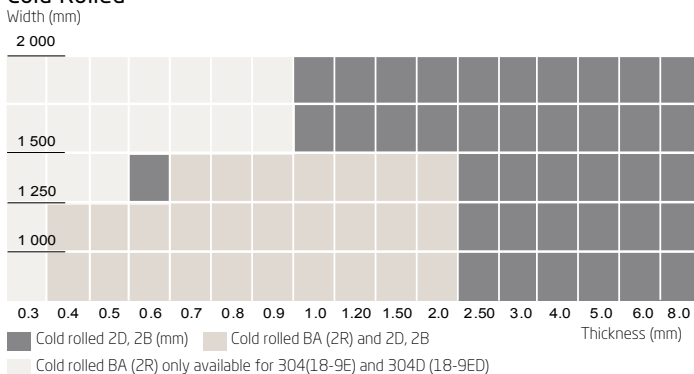

Polishing

The surface of our 304ED (18-9DDQ) is suitable for all kinds of polishing (grit, scotch-brite, electro polishing).

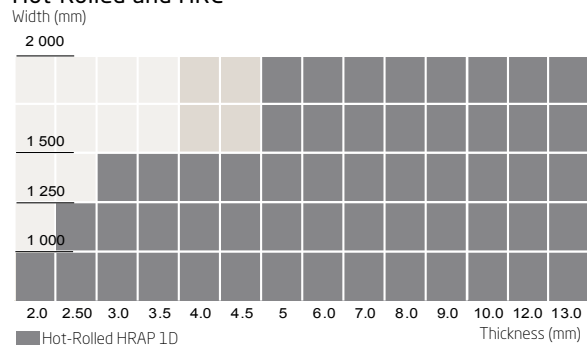

Size range

Our size range is based on our production capabilities. For the latest information per grades on our offer, please consult us.

Cold Rolled

Hot-Rolled and HRC

For 2.00mm thick under 1,000 wide: only available for 304(18-9E) and 304D(18-9ED), not for 304ED(18-9DDQ). For > 1500mm wide: only available for 304(18-9E)
